

Some notes regarding assignment submissions:

1. Usually, assignments would be uploaded on Thursdays and the deadline would be next Thursday before your lecture.
2. Upload your assignments to brightspace. Refer to submission deadlines on brightspace. Please use the file name as *A*_firstname_ID*
3. To avoid confusion, If you're working in a group of two, only one of you need to submit and mention both of your names in the MATLAB script.
4. You are to submit a single M-File, BUT:
 - Make sure you have ALL your answers as comments at the TOP of your file. I will be reading them first.
 - Have different questions of the assignment as different blocks in your Matlab script. This is especially important since most often, I will want to simulate a later question e.g. Q3 and don't want to run your script for Q1,Q2. I do not wish to comment/ un-comment sections of your M-file myself, unless necessary. I will NOT simulate your M-file as a whole.
 - Therefore: use '%%' to distinguish different sections of your code. Every section can be run independently using < ctrl + enter >. Try simulating every section independently before submitting the file.
 - Give proper headings to every section and additional comments wherever appropriate. Variables need to be assigned every section.
 - Commands like 'clc', 'close all' at the top of every section would be useful
 - Do not keep unnecessarily long 'for' loops.
5. Contact me, Yang Liu (Y.Liu-26@tudelft.nl) (also on teams), if you have any questions related to assignments or evaluations.

We recommend to format your script in this way
Also add your and your group member's name at the beginning

```
%% Question A
%*****
% 1) Required frequency Fs: xx Hz
% 2) Overload input level: xx V
% 3) The difference and the explanation: ...
%*****
clear y w time_ma b Pffty scPfy
close all;
format long;
clc;

%Input signal definition
%Sinusoidal input
sig_freq = 2.003;
fs = 1000;
nr_periods = 10;
nr_bits = 1;
amplitude = 0.7;
offset = 0.0;

nr_points = round(nr_periods*fs/sig_freq);
in = offset + amplitude*sin(2*pi*[1:nr_points]/(fs/sig_freq));

%% Question B
%*****
% The minimum gain: xx
%*****
% This part of the code pre-allocates the variables to make the code both run
```

Segment your script for each question using %%

Your answer to the question

Your code

The second question
